# Example of request form

It is an example of request form (stage 1) which needs to be a part of legacy system working on PHP 5.3.2, using:

- Composer – PSR-4 (for project folder)

- Twig – template engine

- Eloquent – ORM and query builder

- Phinx – db migrations

Submited example of code only building form (Twig, Semantic-UI) based on configuration saved in database (names, lablels, tooltips, input filters, etc.). Saving form is not implemented on this stage.
